

Group ART – Model Prototype Overview

The model is used for detecting good or bad posture within an office environment. It uses Tensorflow and MediaPipe for the extraction and detection of body key points with the assistance of YOLOv5 for person detection. The prototype is used by feeding it a video in which the model will infer the video and provide results after the inference. The results will be the video with bounding boxes and other information related to body posture.

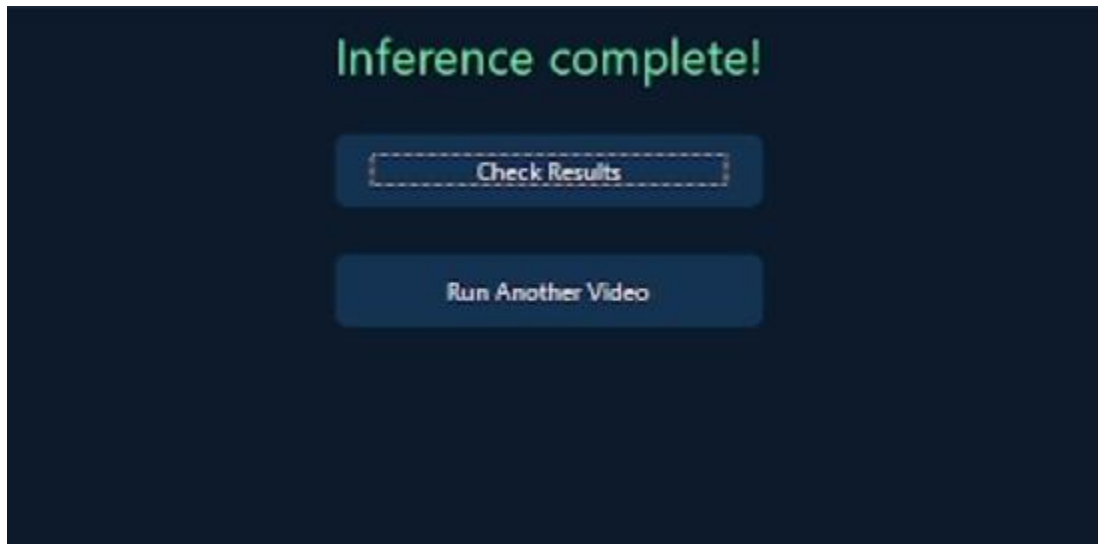

A. Video Upload UI

B. Inference Loading UI

C. Inference Results UI

D. Sample Video Results
